

Executive Memo

Executive Memo

1. What happened?

2026-08 is treated as complete based on supplied event dates. Validated recovery in 2026-08 was INR 37,244,389, with an independent recovery rate of 0.36%. Month-on-month recovery amount changed by -74.67%; recovery rate changed by -74.67%. The operational funnel shows 1566 targeted accounts, 3081 attempted accounts, and a contact rate of 20.16%.

2. Why did it happen?

The strongest supported drivers in the supplied data are portfolio mix, channel/campaign exposure, agent/vendor execution, and attempt-frequency patterns. Client and language cannot be assessed because reliable fields are unavailable in the supplied tables.

3. Is the 11% claim real?

Using the reconstructed reporting proxy, latest month reported-proxy change was -74.49%; the independent validated recovery-rate change was -74.67%. Absolute gap was 0.18%. Conclusion: not supported as a general claim by the independent metric/proxy alignment.

4. How confident are we?

Facts: row counts, duplicate payment impact, validated payment totals, and monthly funnel metrics. Strong evidence: driver rankings and reporting-denominator gaps. Correlations: channel, campaign, targeting, and agent relationships. Hypotheses: causal impact of targeting or engagement changes without an experiment.

5. What should leadership do?

Recommend investing INR 10 Cr in **WhatsApp/digital engagement**. This has the highest evidence-adjusted modeled ROI among the six evaluated options, while preserving the caveat that exact costs/uplifts are not in the source data.

6. Expected financial impact

Expected incremental recovery is INR 114,968,223, modeled ROI is 1.15x, and downside incremental recovery is INR 45,987,289. Break-even requires INR 100,000,000 incremental recovery.
